

*Traditionally, home care provides* your patients with a number of in-home visits each week. Now, when their medical condition warrants it, we can offer the option of monitoring their health status on a daily basis.

*To provide this enhanced level* of care, we have partnered with a company called HomMed™ LLC. We will be utilizing the innovative HomMed Monitoring System in selected patients' homes. Each day, the monitor will collect vital signs such as heart rate, blood pressure, oxygen saturation and weight. A glucose meter, spirometer, and the Protime Microcoagulation System are additional features that can be attached for specialized patients. Each morning, the monitor talks the patients through the process, then automatically transmits the data to our offices where our staff will review their condition.

*The vital signs data* is stored in a central station computer at our

offices and is available anytime you would like to review it. For instance, we could fax you a graphical trend of your patients' vital signs the morning of their office visit. You may find this capability especially useful in helping treat your

post-surgical patients, congestive heart failure patients, hypertensive patients and those on beta-blockers.

*The HomMed Monitoring System* has been extensively tested in several major teaching institutions with outstanding results.

The system has been shown to be particularly effective at reducing E.R. visits and repeat hospitalizations. The HomMed Monitoring System has the Federal Food and Drug Administration (FDA)'s 510-K Class II status approval.

*HomeCall of Stillwater, Inc.* is the *only* agency with this capability in this area. While we will continue to visit your patients in their homes, we will also monitor them on a daily basis when we can't be there. You provide your patients with the highest quality of care in your office; our agency will extend that care to your patients' homes.
